SKILLS

- Python
- Flask
- React
- NextJS
- HTML5
- CSS3
- Java

EDUCATION

- The Odin Project
- Udemy
- Leetcode

If you want to see all the related code, you can visit my github:

ABOUT ME

Self-taught programmer. I taught myself everything I currently know about programming using resources available online, both free and paid.

Personally, I like modern and intuitive user interfaces, but I also enjoy designing and building server-side logic. I strive to maintain readability and good programming practices to keep my code scalable and efficient.

EXPERIENCE

- **Fullstack Developer**

- **GetaPro**

GetaPro is a professional application for managing research projects. It started as a school assignment, but evolved into a sleek remake of an earlier version. It supports real-time collaboration, stores data using Supabase, and includes an integrated AI assistant to help throughout the process. I used Next.js and Tailwind to craft a solid, modern platform.

- **BeeGreat**

BeeGreat is an app designed to help students prepare for a local English spelling competition. It was developed using Next.js as a way to test the “vibe coding” method... but, as usual, I ended up doing everything myself. An educational project with a pinch of resignation and an unhealthy amount of coffee.

- **WTrascriber**

WTrascriber is a small, free SaaS that allows you to transcribe audio and video using the magic of Whisper, OpenAI's API. Built with React, it's useful, functional, and patiently awaiting a upgrade with Next.js.

- **Backend Developer**

- **CRUD App with SQLite**

Design and program a scalable, efficient, and secure backend capable of performing queries, creating elements, updating them, and securely deleting data using Python 3.2 and SQLite. Additionally, the backend incorporates best practices to prevent SQL injections.

- **Login/Register App with SQLite**

I managed to create a full-stack application, but mostly backend, to access and log into a local database. The application was programmed in Python 3.2 and uses SQLite to store data. It uses best practices to maintain readability and prevent SQL injections.
